the second edition of the boost c libraries introduces 72 boost libraries that provide a wide range of useful capabilities they help you manage memory and process strings more easily they provide containers and other data structures that go well beyond what the standard library offers they make it easy to build platform independent network applications simply put these 72 libraries greatly expand your c toolbox the second edition contains more than 430 examples all examples are as short as possible but they are complete so you can compile and run them as is they show you what the boost libraries offer and give you

a head start on using the libraries in your own applications the goal of this book is to increase your efficiency as a c developer and to simplify software development with c the boost libraries introduced in this book will help you write less code with fewer bugs and finish projects faster your code will be more concise and self explanatory and more easily adapted when requirements change the second edition is based on the boost libraries 1 55 0 and 1 56 0 with the latter version having been released in august 2014 the examples are based on c 11 and have been tested with visual studio 2013 gcc 4 8 and clang 3 3 on various platforms for boost libraries which were incorporated into the c 11 standard library differences between boost and the standard library are highlighted the boost libraries are one of the most important and influential open source c libraries their source code is available under a permissive free software license several boost libraries have been incorporated into the c 11 standard library the boost libraries are developed and supported by the boost community a worldwide developer community with a strong interest in pushing c boundaries further

filled with dozens of working code examples that illustrate the use of over 40 popular boost libraries this book takes you on a tour of boost helping you to independently build the libraries from source and use them in your own code the first half of the book focuses on basic programming interfaces including generic containers and algorithms strings resource management exception safety and a miscellany of programming utilities that make everyday programming chores easy following a short interlude that introduces template metaprogramming and functional programming the later chapters are devoted to systems programming interfaces focusing on directory handling i o concurrency and network programming

introducing the boost libraries the next breakthrough in c programming boost takes you far beyond the c standard library making c programming more elegant robust and productive now for the first time a leading boost expert systematically introduces the broad set of boost libraries and teaches best practices for their use writing for intermediate to advanced c developers björn karlsson briefly outlines all 58 boost libraries and then presents comprehensive coverage of 12 libraries you're likely to find especially useful karlsson's topics range from smart pointers and conversions to containers and data structures explaining exactly how using each library can improve your code he offers detailed coverage of higher order function objects that enable you to write code that is more concise expressive and readable he even takes you behind the scenes with boost

revealing tools and techniques for creating your own generic libraries coverage includes smart pointers that provide automatic lifetime management of objects and simplify resource sharing consistent best practice solutions for performing type conversions and lexical conversions utility classes that make programming simpler and clearer flexible container libraries that solve common problems not covered by the c standard library powerful support for regular expressions with boost regex function objects defined at the call site with boost bind and boost lambda more flexible callbacks with boost function managed signals and slots a k a the observer pattern with boost signals the boost libraries are proving so useful that many of them are planned for inclusion in the next version of the c standard library get your head start now with beyond the c standard library

data clustering is a highly interdisciplinary field the goal of which is to divide a set of objects into homogeneous groups such that objects in the same group are similar and objects in different groups are quite distinct thousands of theoretical papers and a number of books on data clustering have been published over the past 50 years however few books exist to teach people how to implement data clustering algorithms this book was written for anyone who wants to implement or improve their data clustering algorithms using object oriented design and programming techniques data clustering in c exploits the commonalities of all data clustering algorithms to create a flexible set of reusable classes that simplifies the implementation of any data clustering algorithm readers can follow the development of the base data clustering classes and several popular data clustering algorithms additional topics such as data pre processing data visualization cluster visualization and cluster interpretation are briefly covered this book is divided into three parts data clustering and c preliminaries a review of basic concepts of data clustering the unified modeling language object oriented programming in c and design patterns a c data clustering framework the development of data clustering base classes data clustering algorithms the implementation of several popular data clustering algorithms a key to learning a clustering algorithm is to implement and experiment the clustering algorithm complete listings of classes examples unit test cases and gnu configuration files are included in the appendices of this book as well as in the downloadable resources the only requirements to compile the code are a modern c compiler and the boost c libraries

robotic sailing 2017 this book contains the peer reviewed papers presented at the 10th international robotic sailing conference which was organized in conjunction with the 10th world robotic sailing championship held in horten norway the 4th 9th of september 2017 the seven papers cover topics of interest for autonomous robotic sailing which represents some of the most challenging research and development areas the book is divided into two

parts the first part contains papers which focus on the design of sails and software for the assessment and predication of sailboat performance as well as software platforms and middleware for sailboat competition and research the second part includes algorithms and strategies for navigation and collision avoidance on local mid and long range the differences in approach in the included papers show that robotic sailing is still an emerging cross disciplinary science the multitude of suggestions to the specific problems of prediction and simulation of sailboats as well as the challenges of route planning anti grounding and collision avoidance are good indicators of science in its infancy hence we may expect the future to hold great advances for robotic sailing
