the calculus of relations has been an important component of the development of logic and algebra since the middle of the nineteenth century when augustus de morgan observed that since a horse is an animal we should be able to infer that the head of a horse is the head of an animal for this aristotelian syllogistic does not suffice we require relational reasoning george boole in his mathematical analysis of logic of 1847 initiated the treatment of logic as part of mathematics specifically as part of algebra quite the opposite conviction was put forward early this century by bertrand russell and alfred north whitehead in their principia mathematica 1910 1913 that mathematics was essentially grounded in logic logic thus developed in two streams on the one hand algebraic logic in which the calculus of relations played a particularly prominent part was taken up from boole by charles sanders peirce who wished to do for the calculus of relatives what boole had done for the calculus of sets peirce s work was in turn taken up by schroder in his algebra und logik der relative of 1895 the third part of a massive work on the algebra of logic schroder s work however lay dormant for more than 40 years until revived by alfred tarski in his seminal paper on the calculus of binary relations of 1941 actually his presidential address to the association for symbolic logic

algebraic semantics of imperative programs presents a self contained and novel executable introduction to formal reasoning about imperative programs the authors primary goal is to improve programming ability by improving intuition about what programs mean and how they run the semantics of imperative programs is specified in a formal implemented notation the language obj this makes the semantics highly rigorous yet simple and provides support for the mechanical verification of program properties obj was designed for algebraic semantics its declarations introduce symbols for sorts and functions its statements are equations and its computations are equational proofs thus an obj program is an equational theory and every obj computation proves some theorem about such a theory this means that an obj program used for defining the semantics of a program already has a precise mathematical meaning moreover standard techniques for mechanizing equational reasoning can be used for verifying axioms that describe the effect of imperative

programs on abstract machines these axioms can then be used in mechanical proofs of properties of programs intended for advanced undergraduates or beginning graduate students algebraic semantics of imperative programs contains many examples and exercises in program verification all of which can be done in obj
