transport obviously within a single special issue it is impossible to provide a comprehensive concise overview of the state of the art within the field instead a thematic approach is followed focusing on the motivational aspects of risk taking and deviant behavior preceded by a general overview of the main topics in the field it is concluded with a research note about the analysis of the psychological literature on driver behavior simonet and wilde discuss risk perception and acceptance and acceptance within the framework of risk homeostasis theory west and hall discuss individual differences in terms of risk social motivation and attitudes towards traffic law violations groeger and chapman address the same issues but in a strictly experimental stance manipulating normative information presented to drivers these papers are a representation of where traffic psychology seems to be heading a realization that driver behavior is determined not only by performance factors i e what he or she is willing to do which are governed by individual cultural and situational variables the literature analysis carried out by sivak shows that this focus is as yet not apparent in the general literature where alcohol and driver performance still are the dominant topics it is hoped that this special issue will convince psychologists that traffic and transport is a fascinating field of application

a road traffic participant is a person who directly participates in road traffic such as vehicle drivers passengers pedestrians or cyclists however traffic accidents cause numerous property losses bodily injuries and even deaths to them to bring down the rate of traffic fatalities the development of the intelligent vehicle is a much valued technology nowadays it is of great significance to the decision making and planning of a vehicle if the pedestrians intentions and future trajectories as well as those of surrounding vehicles could be predicted all in an effort to increase driving safety based on the image sequence collected by onboard monocular cameras we use the long short term memory lstm based network with an enhanced attention mechanism to realize the intention and trajectory prediction of pedestrians and surrounding vehicles however although the fully automatic driving era still seems far away human drivers are still a crucial part of the road driver vehicle system under current circumstances even dealing with low levels of automatic driving vehicles considering that more than 90 percent of fatal traffic accidents were caused by human errors thus it is meaningful to recognize the secondary task while driving as well as the driving style recognition to develop a more personalized advanced driver assistance system adas or intelligent vehicle we use the graph convolutional networks for spatial feature reasoning and the lstm networks with the attention mechanism

for temporal motion feature learning within the image sequence to realize the driving secondary task recognition moreover aggressive drivers are more likely to be involved in traffic accidents and the driving risk level of drivers could be affected by many potential factors such as demographics and personality traits thus we will focus on the driving style classification for the longitudinal car following scenario also based on the structural equation model sem and strategic highway research program 2 shrp 2 naturalistic driving database the relationships among drivers demographic characteristics sensation seeking risk perception and risky driving behaviors are fully discussed results and conclusions from this short book are expected to offer potential guidance and benefits for promoting the development of intelligent vehicle technology and driving safety
